 $-\infty = \sup(\emptyset).$ 

exceedances over  $u: T_i \sim \mathsf{PoisProc}(\lambda_u)$ marks:  $Y_i \sim \mathsf{GPD}(u, \sigma_u, \xi)$ excesses:  $Y_i - u \sim \mathsf{GPD}(0, \sigma_u, \xi)$ .

The maximum M of the marks  $Y_i$  on an interval with duration w has a tail which is  $\mathsf{GEV}(\mu_w^\star, \sigma_w^\star, \xi^\star)$ . It has a

mixed distribution with an atom at M =
